

# UV FINISHES

Our patented ultraviolet finishing process to apply sealants and top coatings to our furniture is one of the most cutting-edge systems in the market today. The finishes used by most furniture manufacturers emit Volatile Organic Compounds (VOCs), which can escape as airborne pollutants and toxins that are harmful to humans. Our process captures 97% of these toxic VOCs by using specially formulated waterbased finishes that are cured in seconds with ultraviolet energy. And being nearly 13 times cleaner than the strictest pollution control regulations in the U.S., it's better for the planet too.

Wood is a product of nature, which varies from tree to tree and piece to piece. The beauty of wood is its grain. The samples displayed are digital photographs of our UV house finishes shown on Beech wood. Actual finish samples and products may vary. Wood samples are available upon request.

*Always order samples as screen and printed colors may not be exactly representative.*
